

System of Equations 3

Goal:

- to solve a system of equations using elimination method

The third method for solving systems is called the elimination method. It gets its name because algebraically we eliminate one variable.

Solve: $\begin{array}{r} x+2y=7 \\ -x+4y=11 \end{array}$ ①
②

Look at the equations and see if any variables have the same number in front.

$$\begin{array}{r} x+2y=7 \\ + \quad -x+4y=11 \\ \hline 0 \quad 6y=18 \end{array}$$

Add or subtract the equations to eliminate one variable.

"x" is eliminated, now solve for "y"

$$\frac{6y}{6} = \frac{18}{6}$$

$$y = 3$$

substitute $y=3$ into either equation

$$x + 2y = 7 \quad \text{①}$$

$$x + 2(3) = 7$$

$$x + 6 = 7$$

$$x = 1$$

Solution $(1, 3)$

Solve: $2x + 3y = 11$ (1)
 $x + 3y = 13$ (2)

$$\begin{array}{r} \textcircled{1} - \textcircled{2} \\ 2x + 3y = 11 \\ - \quad x + 3y = 13 \\ \hline x = -2 \end{array}$$

plug $x = -2$ into either equation

$$\begin{array}{r} x + 3y = 13 \quad \textcircled{2} \\ - 2 + 3y = 13 \\ \hline 3y = 15 \\ \frac{3y}{3} = \frac{15}{3} \\ y = 5 \end{array}$$

Solution $(-2, 5)$

Solve: $x-2y=4$
 $2x+3y=8$

$\begin{matrix} \textcircled{1} \\ \textcircled{2} \end{matrix} \times 2$ $2x-4y=8$ $\textcircled{1}$

$$\begin{array}{r} 2x-4y=8 \quad \textcircled{1} \\ - \quad 2x+3y=8 \quad \textcircled{2} \\ \hline \end{array}$$

$$\frac{-7y}{-7} = \frac{0}{-7}$$

$$y=0$$

sub. $y=0$ into an equation

$$x-2y=4 \quad \textcircled{1}$$

$$x-2(0)=4$$

$$x=4$$

Solution $(4,0)$

Solve: $-4x+3y+2=0$ (1)
 $6x-5y=-2$ (2)

$$\begin{aligned} -4x+3y &= -2 & \textcircled{1} \\ 6x-5y &= -2 & \textcircled{2} \end{aligned}$$

Look at coefficient of each variable and try to find an LCM.

(choose easiest)

$$\begin{array}{cc} 4, 6 & \text{or} & 3, 5 \\ 2^2, 2 \cdot 3 & & 3, 5 \end{array}$$

$$\begin{array}{cc} \text{LCM} = 2^2 \cdot 3 & \text{LCM} = 3 \cdot 5 \\ = 12 & \end{array}$$

$$\textcircled{1} \times 3 \quad -12x + 9y = -6$$

$$\textcircled{2} \times 2 \quad + \quad 12x - 10y = -4$$

$$-y = -10$$

$$y = 10$$

sub $y=10$ into an equation

$$-4x + 3y = -2 \quad \textcircled{1}$$

$$-4x + 3(10) = -2$$

$$-4x + 30 = -2$$

$$-4x = -32$$

$$x = 8$$

$$(8, 10)$$

Homework
Handout
#9-12

LCM 14, 18

$$14 \\ = 2 \cdot 7$$

$$18 \\ = 2 \cdot 9 \\ = 2 \cdot 3^2$$

$$\text{LCM} = 2 \cdot 3^2 \cdot 7 \\ = 126$$
